

Not, re telepathy. let NP try again after meeting. Refuse any data is given him.
Suggested Protocol for Operational Remote-Viewing Exercise

SG11 *NOTE: At the 27 June 74 meeting (re again telephonically on 28 June) [redacted] strongly urged*
SG11 *two variations: (1) that [redacted] make a visit to the SRI in all that he can - submit a*
the installation & give it to his boss; (2) that all potential transcripts/drawings/sketch models be
sent to DC for evaluation by NPIC before [redacted] goes to SRI
Experiment: Remote viewing, operational.

ILLEGIB Target: Technical facility. SG11
ILLEGIB Purpose: To obtain technical information sufficient to differentiate
among possible alternative technical processes of interest.

SG11 Plan: Carry out a remote-viewing experiment on client-designated
operational target of interest with minimum information
supplied to subject (compatible with designating target
unambiguously).
Mr. P. Price
at SRI
8-12 July, 1974

SG11 Program: (a) Experiment is to be carried out with participation of
person knowledgeable of structure of target facility
and technical processes of interest.

SG11 *Provide coordinate,*
locate on map, no drawings
or pictures for first
phase.
(b) Provide viewer with target location, by street map
if possible, and provide viewer with picture or drawing
of target facility containing only enough information to
permit visual recognition during target acquisition.

SG11 *[redacted] will not be*
physically present, will
evaluate tapes, transcripts
after the session without
confronting Mr. Price
(c) Viewer moves into real-time viewing. Knowledgeable
participant listens to viewer description, lightly
questioning if necessary, in an effort to calibrate
viewer description on the basis of information known
a priori to participant but not to viewer.

SG11 *Provided [redacted] judges*
initial response contains
some real information,
"d" will be implemented
and Price made writing
of U.S. Government Intelligence
and [redacted] role.
(d) Move into phase of more leading questioning, if necessary,
again providing as little cueing as possible so as to
maximize uncued information flow from viewer. Purpose
of this phase is to permit viewer to originate freely
while being guided into area of technical interest. This
is to permit relevant but unprejudiced viewing on the part
of the viewer and continuing calibration on the part of
the knowledgeable participant.

SG11 *broad descr. of subject*
complete - 4 coordinates
at 10%+ accuracy then
2 more identified descr.
descr. of subject of body
in hand & D's activities.
(e) Break operation of real-time viewing at this point.
Depending on results, provide viewer with minimal
additional information, e.g., floor plan, process of
interest, etc., to permit two-or three-day period of
relatively unbiased but focussed generation of spontaneous
impressions by viewer.

ILLEGIB

- (f) Discuss data to date with viewer, and then resume real-time viewing, providing viewer with additional known information in order to maximize possible information retrieval, recognizing that the additional information supplied to the viewer at this point is at the cost of calibration within the experiment.
- (g) If and when appropriate, follow experiment with evaluation as to quality of results (to degree possible, recognizing issues of sensitivity).

SG1I

9 July

[REDACTED] will arrive Palo Alto, Ca & be available for evaluating the first data. Whenever data is judged to contain a significant amount of unambiguous data, [REDACTED] will introduce himself as Government intelligence and assume Mr Price of serious interest.

SG1I

10-12 July

Will continue to question Mr. Price and cue as necessary to be assured he has located the exact target building. ~~When~~ If and when Mr. Price has located exact target, he will be asked questions provided by [REDACTED]

SG1I

after test, transcript will be provided to NPIC to score all physical plant descriptions.

- a) unambiguously correct
- b) ambiguous
